notes 5

1. commands

`ls`
‘‘‘

- tto see everything, including hidden files `bash ls -a ### ls` **definition:** this command lists all the files and folders that are in your directory **formula:** `ls [options] [path]` **examples:**
- and to see what's in the folder:

  “‘bash

`pwd`

- **definition:** stands for print working directory. It shows you the full path of where you are right now in the terminal
- **formula:** `pwd`
- **examples:**
  - to check your current location:
    ```
    pwd
    ```

`cd`

- **definition:** stands for change directory and you use this to move around from folder to folder
- **formula:** `cd [directory-name]`
- **examples:**
  - to jump back to your home folder:
    ```
    cd ~
    ```
  - to go back up one folder level:
    ```
    cd ..
    ```

---

2. questions

1. What is a variable?

a variable is basically a container that holds a value or bit of data in the system which you can use and change later in a script or command

2. How do I use a variable?

you set it by giving it a name and a value (like `name=value`), and whenever you want to use what's inside it, you put a dollar sign in front of it (like `$name`).

3. What is an environment variable?

it's a system wide variable that stores settings or info that the operating system and running programs use

4. What is a user defined variable?

a variable that you (the user) create yourself in the terminal or a script for whatever specific thing you're working on.

5. What is the root directory?

it is the absolute highest starting point of the entire Linux file system, represented just by a single slash (`/`).

6. What does "Parent Directory" mean?

it's the folder that sits one level directly above the folder you are currently inside. You point to it using `..`

7. What does "Current working directory" mean?

it's simply the folder that your terminal window is currently focused on and working inside right now.

8. What is an absolute path? Include an example

an absolute path is the full or exact address of a file or folder starting all the way from the root directory (`/`). * *example:* `/home/student/Documents`

9. What is a relative path? Include an example

a relative path is a shortcut address that tells you where a file or folder is based on *where you are right now*. * *for example:* if you are in your home folder, just typing `Documents/homework-files` is a relative path.

10. What is the difference between "Your home directory" and "The home directory"?

- *your home directory* is your personal user folder (like `/home/student`), where your own files live.
- *the home directory* refers to the main folder (`/home`) that holds all the different user accounts home folders on the machine.
